Trusted Computing Group

Storage Interface Interactions Specification Summary

January 2009

The Storage Work Group of the Trusted Computing Group has several specifications. These are written in an interface-agnostic manner for trusted peripherals containing any storage medium. The Storage Interface Interactions specification provides the 'glue' between these high-level specifications and the real-world host interfaces.

The Storage Interface Interactions specification:
1) **maps interface-specific resets to trusted peripheral resets;**
2) **maps trusted peripheral errors to interface-specific error reporting mechanisms;**
3) **describes interface-specific command protocols which deliver commands to trusted peripherals and return data to the host; and**
4) **describes other interface-specific interactions with a trusted peripheral.**
